

NYC / AI AGENT SECURITY SUMMIT

Your Agent Escaped Without Escaping the Sandbox

Yossi Eliaz

Principal Engineer and Head of DevRel at Incredibuild.com

October 21, 2026

You bought a cage

**Isolation asks:
can it touch the host?**

**Release asks:
should we believe
these bytes?**

Those two questions got collapsed.

The control is green. You still lost.

checker.py	hash unchanged
expected.json	worker-written
task check	PASS
independent "1,,3"	REJECT required
actual	[1, 3]

You protected the judge. Not what the judge believes.

Recorded Linux isolation run + factory

We verified A. We shipped B.

Publish from the live path after a swap	Wrong artifact
Hash the path, hash it again	The path can move
Evaluate and publish the frozen object	Same digest
Approval for A applied to B	Denied

A valid signature on the wrong bytes is still the wrong bytes.

Recorded Linux isolation run + factory

The process never left

```
identity    we handed it another project's token
files       the mount did exactly what we configured
release     the allowed host was never the question
```

Containment held. The grant did the work of an escape.

Recorded Linux isolation run + factory

Stop taking testimony from the box

**The candidate is a subject.
It is not a witness.**

Freeze the bytes. Compare off the worker. Publish that object.

A green harness is a log line. It is not an approval.

Recorded Linux isolation run + factory

Same job. Different witness.

Good parser, frozen	Published. 1,,3 rejects.
Buggy parser	Rejected
Worker PASS file	Ignored
Worker expected.json	Ignored
Swap after freeze	Denied

Recorded Linux isolation run + factory

If the writer is also the witness

Ask

If the answer is the box, you lost

Whose identity?

You handed it over

Which files, including tomorrow's?

Snapshots and forks keep the crime

Which recipient, which contents?

The allowed host was the wrong question

Who says these bytes are true?

You do not have acceptance. You have a diary.

CONTAINMENT IS NOT ATTESTATION

Who gave this process the authority?

github.com/zozo123/nyc-talk

Appendix / Reproduction

```
make factory      # freeze, judge, gate; no cloud
make demo         # educational Linux isolation lab
make deck         # evidence check + PDF
```

29 lab checks passed, 6 factory checks passed.

Appendix / Limits

A class identification, not a vendor bug.

Deterministic scripts. Five cases prove five cases.

In-sandbox grading is known. File-integrity of the checker can still pass.

Timeouts are no approval, not a successful defense.

Appendix / Primary references

Anthropic reward hacking

Process-exit graders are known

SLSA verifying artifacts

A valid statement can still name the wrong bytes

pytest plugins

Loading workspace code is documented. Trusting it as acceptance is ours.
